# Progress Report

## 2022 South Dakota Nutrient Research and Education Council Invited Proposals

<b>Progress Report Title:</b>	Interim Report - Due July 1, 2022
<b>Applicant Name:</b>	Jason Clark
<b>Application Title:</b>	Fertilizer N Rate Recommendation Update for Corn: Year 2
<b>Application ID:</b>	1829
<b>Review Deadline:</b>	07/1/2022 11:59 PM

## Interim Report - Due July 1, 2022

### Project

	Start Date	End Date
<b>Start and End Dates of Funding:</b>	01/1/2022	12/31/2022
<b>Title of Project:</b>	Fertilizer N Rate Recommendation Update for Corn	
<b>Project Description:</b>	<p>Corn is the leading crop in South Dakota (SD). Successful production heavily relies on N fertilizer application to maximize yields. Non-optimal N rate use can affect the farmer's profitability and the environment. The current N fertilizer guideline is more than 10 years old. Increased yield levels and newer genetics warrant completing studies aimed at updating the current guidelines. The overall goal of the research is to reevaluate and update (if necessary) the current corn fertilizer N rate recommendations through identifying and using recent research data and conducting N rate field trials throughout the state. At the end of the first 4 years of this project, the current fertilizer N rate recommendation will be updated. The project can help to improve farmer's profitability and lower environmental impact associated with over application of N fertilizer.</p>

## Fertilizer N Rate Recommendation Update for Corn

**PI:** Jason Clark, Soil Fertility Extension Specialist and Assistant Professor, SDSU, Department of Agronomy, Horticulture & Plant Science, jason.d.clark@sdstate.edu, (801) 644-4857

**Co-PIs:** Péter Kovács, Assistant Professor, Precision Ag Cropping Systems and Anthony Bly, SDSU, Soils Field Specialist

### Summary

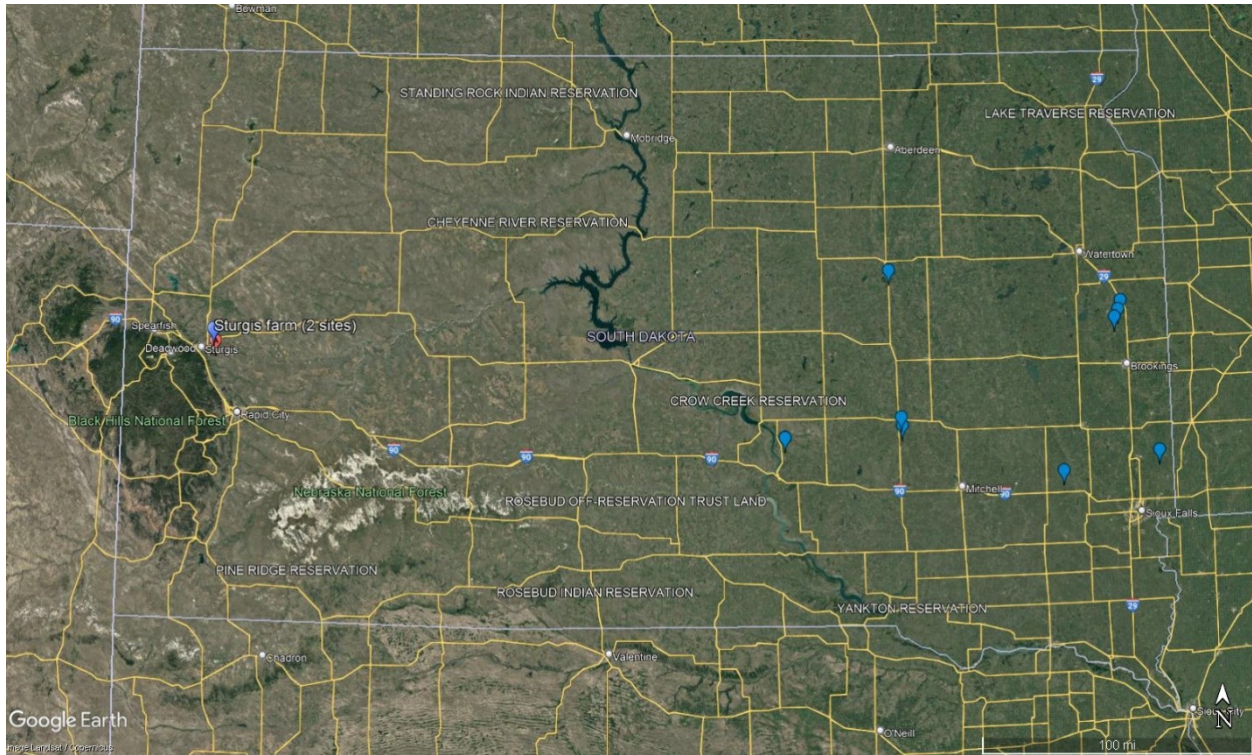

Corn is the leading crop in South Dakota (SD). Successful production heavily relies on N fertilizer application to maximize yields. Non-optimal N rate use can affect the farmer's profitability and the environment. The current N fertilizer guideline is more than 10 years old. Increased yield levels and newer genetics warrant completing studies aimed at updating the current guidelines. The overall goal of the research is to reevaluate and update (if necessary) the current corn fertilizer N rate recommendations through identifying and using recent research data and conducting N rate field trials throughout the state. At the end of the first 4 years of this project, the current fertilizer N rate recommendation will be updated. The project can help to improve farmer's profitability and lower environmental impact associated with over application of N fertilizer.

### Goal and Objectives:

The goal of this project is to update the fertilizer N rate recommendation for corn in SD. The objectives of the project are i) to continue with field studies in 2020 to collect corn yield response to N rate application data and ii) to create a corn N fertilizer response database where data from past, current, and future N fertilizer rate studies can be combined and evaluated now and on-going into the future to be able to more easily evaluate the current N recommendation and update as needed.

### 2022 Results:

- Study was conducted at 12 field sites in central and eastern South Dakota.
- Soil samples were collected for soil health (0-6 in.) and soil fertility (0-6, 6-24 in.) prior to planting and fertilization.
- At-planting nitrogen fertilizer treatments ranging from 0-200 lbs ac<sup>-1</sup> were applied.
- Sidedress nitrogen applications for split applications were/will be applied at either V6 or V10
- Plant and soil (0-12, 12-24 in.) samples will/were collected at V6 and V10 for both single and split applications totaling N rates of 80 or 120 lbs N ac<sup>-1</sup> at four of the sites.
- Plant and soil samples are currently being processed and prepared to be evaluated for soil physical, chemical, and biological parameters.

**Figure 1.** Twelve field research locations where the N rate and timing studies are established for the 2022 growing season.

**Impacts:**

- Evidence that the current N fertilizer recommendation can be improved.
- Training of a graduate and several undergraduate students in soil fertility.
- 50 min. presentation of current N fertilizer rate study results to 105 persons
- Creation and publication of YouTube video series regarding use and accuracy of South Dakota’s N recommendation system.
